1 Introduction

1.1 Scope

This document is describe the radio system in the OA-II VEH and BAS system.

1.2 Purpose

The goal for this document is to create a radio system what will fit the requirement for the OA-II system.

1.3 Relevant Documents

DR00001 - OA-II Backplane Bus System
DR00002 - OA-II VEH Camera System Design
DR00004 - OA-II VEH TAM System Design
DR00006 - OA-II VEH Storage System Design
DR00007 - OA-II BAS Bus System Design
ER00002 - ORBiT Avionics System II Requirements
ES00002 - ORBiT Avionics System II Architecture
ES00003 - OA-II Vehicle Electronics (VEH) System Architecture
ES00004 - OA-II Base Station Electronics (BAS) System Architecture
ES00005 - OA-II VEH Payload Modules General Architecture

Table 1: Summary of Revision History

2 Requirement Analysis

The main requirement of OA-II system in the wireless system can be divide to two major part. The data transmission and location tracking.

2.1 Data Transmission

Base on the requirement of the OA-II system, two type of data will be transmitted in the wireless connection system. The first type of data is vehicle status. This kind of data usually will not use a lot of bandwidth, but require highly reliable link. The second kind of data is live camera data. This kind of data require high bandwidth¹ but do not require highly reliable connection.

2.2 Location Tracking

The location tracking require to use sidetone ranging to help the Main Control Facility and Vehicle to trace location. It require the base station to be cable to send a FM signal out and receive the reply from the rocket and analysis the different between those two.

¹About 500kbp to 1Mbp

3 Existing Radio Module

3.1 RFD 900x-US Modem

The RFD 900x Modem is RFDesign company publish a wireless modem for long range transmission. It already demonstrated by Edge Research labs on a balloon, 57km in India, on Dipoles. It can transmit 224kbit/s by uart. Most of the configuration can be done via the uart interface. The range of this module is up to 40km. However, it do not allow range finding and location tracking.

3.2 LoRa Modem

4 Open Source SDR Module

4.1 HackRF One

The HackRF One is open source SDR module. It can directly connect to the GNU Radio software without additional modification. All the hardware and software sturture are open-source. However, most of the existing module are in a large frame and with only usb interface. It limited the use when apply it on the rocket.

5 Open Source SDR Solution

5.1 AD9361+Matlab

This solution is similar with the opensource SDR module. However, it will offer more freedom in ADC selection and more difficulty on the building process. AD9361 is only one example for all the ADC, DAC chip. Those kind of chip will have good ability to connect to a FPGA or a SoC. The difficult part is how to build it and create correct software to drive it.

6 Recommend Design
